Mchon.a2 3.3

CONFERENCE ON REGIONAL POLICY

HEALTH DEPARTMENT INPUT mem0316a

The attached is a discussion document and not a final ANC Health Department position.

For example the suggestion to put all government health workers (and possibly all other civil servants) on to 3 year renewable contracts, still needs to be debated further. So does the suggestion to delegate the provision of public services to local

authorities and/or to private providers through formal contracts.

However the overall structure of the health services and the division of responsibilities between national, regional and district levels is generally accepted. The major responsibilities should be:

National ... National policy and planning

Redistribution of resources

Regional ... Coordination of all services in region Support of District services

Specialist hospital services

â\200\231rimary Health Care services 1ncliuding

Community Hospital services

The suggested structure and responsibilities of the 3Xegional

Health Authority (RHA) 3re spelt out on page 5. NB DECISIONS TAKEN ON THE STRUCTURE, POWERS AND FUNCTIONS OF LOCAL AND REGIONAL GOVERNMENT

WILL GREATLY AFFECT THE ABILITY OF AN ANC GOVERNMENT TO DELIVER SERVICES TO THE PEOPLE

ADDENDUM I: Detailed functions or District Health Authority

ADDENDUM I: Detailed functions or National Health Authority

### 1. OVERVIEW

The need for an NHS and the principles that will guide an ANC government when setting i t up

are explained in the Health Policy Guidelines adopted at the 1992 ANC Policy Conference . They

include a strong commitment to the Pnmary Health Care approach and are published in the booklet Ready to Govern. This proposal should be read together with those guidelines.

The country will be divided into about 10 Health Regions and about 60 Health Districts.

boundaries of these regions and districts will, as rar as possible. coincide with other political and

administrative boundaries.

There will be a National Health Authorty (NHA) which will allocate the national heaith budget

and will be responsibile for ail heaith care in South Africa. It will develop broad nat ional policies

and will monitor and coordinate both public and private health care.

In order to promote both efficiency and local accountability the NHA will delegate

responsibilities and allocate funds to each District and Regionai Health Authorty (DHA ana

 $\mathtt{RHA})$  . These authorities will in turn delegate many functions to local Service Providers .

The DHAs will be responsible for comprehensive primary health care services. including community hospital services. RHAs will be responsible for supporting and coordinating DHAs.

for specialist hospital services and for monitoring all public and private health care  $\ln$  their

region.

Both DHAs and RHAs will receive most of their budgets directly :rom the NHA. They will be

responsible for ensuring services are provided to their people but they will often dele gate much

of the work (and budgets) to Service Providers.

Service Providers will often be local authorities but may also be non-government organizations

(NGOs), groups of doctors or private companies.

DHAs, RHAs and Service Providers wiil all work within ciear policy guidelines or contracts.

A written agreement wiil specify what they are expected to do. how much money they iil have

to do it and how their performance will be evaluated. Once this is agreed they will be iree to get

on with the job as they think best.

Figures 1. 2. and 3 are simplified diagrams of how funding. evaluation znd worker parucipation  $\left( \frac{1}{2} \right)$ 

in policy making wiil occur.

Table  $\mid$  gives an outline or how the different levels or authority wiil be accountable. through

their controlling bodies. to the people they serve. Figure 4 shows now structures of go vernment

wiil link to the proposed Heaith Authorties and Service Providers.

#### 2. BACKGROUND

South Africa needs a re-structured health service that is able:

- . To meet the present system as it is and change it into what we want for the future. We
- have to start from where the service is today.
- . To place the main emphasis of the service at the local level. The key structure will be
- a District Health Authority (DHA) controlled by, and accountable to. local people. and responsible for seeing that services are available. Regional Health Authorities (RHAs) will exist to support and serve the DHASs and to provide specialised services.
- To be as flexible and adaptable as possible so that many different methods or providing
- and financing services can be used. For example it must allow for a Non- -government health organisation or a private practioner to take part in the mun! = health service.
- To direct money from central government to districts and regions on the basis of population size and health needs. Large communities with many health problems and few facilities will get relatively more or â\200\230he health budzet. This will be the main mechanism of redistribution.

In order to implement national health policies a basic set of national health service t argets must

be agreed upon and funds allocated to achieve these:

Funds will be directed to DHAs and RHAs with as few conditions as possible so as to enc ourage

local approaches to health service delivery. The NHA will judge DHAs and RHAs mainly oy what targets have been achieved with the runds provided.

- 3. Proposed structure of a national heaith service for South Africa See Figures i. Jand  $\hat{\mathbf{A}} \mathbf{S}$ .
- 4. The District Health Authority (DHA)

The whole country wiil be divided into about 60 Health Districts. each with its own DHA . A

DHA wiil normally be responsible for zil puplic primary heaith care services ror about 300.000

peopie in the area or one or more local authorities. The DHA wiil be controlled by the iocal

authorities within its boundaries who wiii sit together with major service providers  ${\tt zn}$  d

community organizauons as the DHA Boara to take all maior decisions such as the appoint ment

Of senior start and the approval of the buaget. In as much as the iocal autnonties wiil be wily

democratic. the people will control the local health services through the DHA.

In addition to the controlling board, the DHA wiil have a profressional start who wiil be

responsible for the day to day work. They wiil manage facilities run by the DHA. collect and

collate relevant epidemiological data and organize the training and development of staf  ${\bf f}$  in the

area. They will also draw up contracts with other service providers to whom services ar  $\mathbf{e}$ 

delegated and monitor their work by means of performance indicators.

Most money for the DHA will come directly from central government. The RHA will not ola y

a major part in deciding how much money a local area will get or how it is spent. The a mount

of money for each DHA will be decided on the basis of budgets submitted to the NHA but the

three main factors will be the population size. the health status of that community and the

existing health care facilities in the area. These will be the main tools ot redistribution ot heaith

care funds.

If local authorities continue, as at present. to raise additional local funds for healt h services.

these funds will also be controlled by the DHA and will be used for the benerit of the wnoie

health district.

The responsibilities of the DHA would be to ensure that there are :

4.1. Primary care services for everyone in the area. These services must include immunization. treatment for acute and chronic illnesses. and maternity, school health, geriatric. workers health and rehabilitation services. The facilities will usually include

clinics, mobile services and community health centres. See addendum | for detailed services.

The provision of primary care services would be guided by national norms set out by the National Health Authority. It is envisaged that DHA's will administer very few services themselves but rather recruit various service providers to do this on a contract basis.

Community hospital services. Most people needing hospital admission have common conditions and will be admitted to community hospitals near their homes and families. These hospitals will also provide 24 hour maternity and casualty care and will be visited.

regularly by specialists from regional hospitals but will be run by non-specialist doct ors.

They will be controlled and run oy the DHA. In this way local people will play a real part in the management of their local hospital.

The rate of provision of community hospital beds by various categones such a maternity. adult medical. children. etc should be agreed upon with the Nauonai Heaith Authonty. If insurficient beds were available in the area it would be possible tor a DHA to contract

with another authority or supplier to provide the service. Sim:iarly. excess local capa city

could be contracted out.

Ambulance and other transport services. Basic levels of provision of these services wil 1

be set out at national level with some variation ror local conditions. Especially in rural

areas a well functioning transport system is an essential part of health care. Adequate funds especially for training of staff and technical backup are essenual. [n many cases the

use of contractors will be appropriate. An example would be the use of taxi services to transport non-emergency patients to hospital.

Environmental health services. These are the services which control the general cleanliness in the community and are involved with issues such as water punty. sanitation. meat inspection. passing building plans as being healthy and so on. The

monitoring	work	is	done	mainly	by	health	inspectors	and	the	number	needed	in	an	area

will vary enormously with local conditions. The number required tor a particular area will be agreed with the Natuonal Heaith Authorty.

The actual provision of clean water and of sanitauon services is often. in a city. a function of the City Engineers department. In pen-urban and rural areas however. and even in some city areas. it is often grossly neglected. The DHA will therefore be responsible for sesing that adequate water and sanitauon services are provided.

4.5. Intersectoral Action The DHA wil be active in liaising and planning interventions with

other sectors at the local level for the promotion of community health. This is particularly

relevant in the areas of housing and social weifare but it applies also to many other a reas.

A District Development Committee wiil be established with representation from local government, from the DHA and from similar bodies in the education. housing, transport and empioyment sectors.

in

. The Regional Health Authority (RHA).

The Regional Health Authorty wiil be responsible for heaith and basic heaith services in its

region which will be made up of a number or health districts. The population of a region wiil

be between 2 and 5 million.

The RHA will be controlled by a board composed of elected representatives from the ioca  $\mathbf{1}$ 

authorities in the re zion dius a smailer number o: lected representauves of regional g overnment.

The combined power of the local authorties wili :herefore be greater than that of the r egion. The

regional tier of government will only have a say in health matters to the extent of its minonty

representauon on the RHA.

In addition to the politically constituted board. a professional and administrative sta ff will be

needed to do the day to day work. The RHA wil eventually denve funds for its work maini

from central government. [ts main responsipilities wiil be to ensure that there is:

tn

1. Supervision of and help to the District Health Authoraties in its region. It is particularly

important that regionally employee specialists provide support and on going education to medical. nursing ana administrative s:aff in the local areas. For example regionally ta sea

medical specialists wiil visit the community hospitals in the region regulariv to ensur e

that clinical standards are maintained. (O Set management Drotocois and to ecucate medical and  $\tilde{}$  ursing starf. In discipiines such as obstetrics, paediatrics and psychiatr v.

community <;-Claiists may be employed specifically "0 support primary care services in the region. Using regional hospital racitities for training pnmary care workers is another

important area of cooperation.

.2. Specialist hospital care wiil be provided by the RHA. If facilities are inadequate 1t wiil

be able to buy services from neignoouning RHA's but an important principle is that essenual specialist services should be available within each region. In the past there was

too much reliance on providing speciaist care only in metropolitan areas. requiring

patients to travel long distances to get essential specialist services. Resources wil be allocated to improve specialist services in the non-metropoiitan regions.

Other specialist care. Any appropriate health care not available at district level will be

procured for patients by the RHA. Difficult operations. specialist consultations. advanced

laboratory tests and the supply of hearing aids would be typical examples of this level or

care. This care will either be provided by the RHA directly in an insutution under its control or it will buy the service from an institution outside its authority. It may do this

on an individual basis or by having a "bulk" contract depending on the condition.

This ability to buy services elsewhere ensures that every patient has pre-arranged access

to highly specialised services wherever in the country they may be provided. For example

the Eastern Cape RHA may have a contract with a Bloemrontein hospital to provide a particularly specialised eve operation to patients from its region.

For "super-specialist" services such as open heart surgery and kidney transplants it wi

usually be the major teaching hospitals in the metropolitan areas that will get the contracts

for providing these very specialised services to RHAs all over the country. This wil be one of the main ways that the teaching hospitals will be financed.

 $\_$  Intersectoral Action The RHA will actively liaise and plan at regional level with oth er

sectors which influence health. This will be done through a Regional Development Committee similar to the one proposed for each district.

The National Health Authority (NHA)

The NHA will take over all health budgets that derive from general taxation. including those that go from central government to local authorities. the provinces. the army. the

prisons and the homelands. It wiil also take over formal ownership or all health faciii ties

owned by any of these bodies. The facilities will be leased to their present owners at  $\frac{1}{2}$ 

nominal rental for 3 vears and within that time a decision wii! be made whether to re.e  $\ensuremath{\mathtt{w}}$ 

the lease or to transfer the facility to a District or Regional Heaith Authority.

The main function of the NHA will be to provide money to DHAs on he basis of population and need. This emphasis on the LOCAL level is crucial in redistributing resources according to need. Money will be allocated separately for pnmary care and for community hospital services. and separately for capital and for operating expenditure. Districts with few facilities will get more money for capital development than those with

many facilities.

Money wiil also be provided to RHAs for their specialist services.

Other important functions wiil include evaluating national health needs and services. formulating national policy, setting nauonal standards for service provision. implemenung

a procurement policy for all medical supplies. and defining and collating a basic set o

 $\ensuremath{\mathtt{r}}$  data that will be collected by and from ail public and private heaith care providers.

# 7. Referral Systems

Good and efficient referral systems are crucial to the success of any health service based

on the primary heaith care approacn. Most patients wiil be seen first at a clinic. From there. most of those who need admission will be referred to a nearby community hospital while a few with very complicated problems will be rererred directly to a specialist (regional) hospital.

Some of those admitted first to a community hospital wiil later be referred to a specia list

hospital for particular investigations or treatment. and many of those admitted to a specialist hospital may be referred back to their local community hospital before being discharged home.

Community and specialist hospitals wiil support each other and both wiil support the clinics and other primary care providers in their areas. Nobody at a clinic will have to  $\circ$ 

"battle" to get a patient admitted to hospital but they wiil expect to get feedback lat er on

the appropriateness of their diagnosis. management and rererral.

Clear management protocois and regional specialists wiil both play important roles ia this

process of on-going education and reedback.

### 8. Long term employment of staff

All existing staff paid mainly or entirely out of funds coming from central government will be offered 3 vear contracts with the NHA. They will be allocated to districts and regions and, to begin with at least. most staff will continue doing what they do at pre sent.

Betore the end of these contracts most stati will be offered new contracts with DH As. RHASs. or service providers. As the division between heaith authorities and providers becomes clearer less and less start will be empioved by health authorities and more and more by service providers.

Three vear contracts that are renewable will give secunty to stati during transition an  ${\tt d}$ 

wiil allow local communities. and a new government. (O Keep stail who work hard and promote the primary health care approach and to drop those who fail to adapt to the new society.

Delegation of budgets and responsibilities through "contracts".

All health authorities will be encouraged to delegate as much ofr their budgets and as many of their responsibilities as possible. The two purposes are firstly to give the pe opie

who actually provide services as much freedom as possible to deciside how best to ao their jobs. and secondly to make them more accountable to the people they serve. Much of this delegation will be done through contracts.

District and RHAs will orten not provide services directly but will instead enter into contracts with a number of organizations  $\hat{a}$ 200\2342rvice providers) who are capable of providing

part of the required services in the area. Contracts will be negotiated between the ser vice

providers and the DHA and will contain precise details of what is to be provided. how it is to be provided and by what the success of the service will be measured. Contracts will be renegotiated regularly. A service provider who repeatedly does meet the standar ds

set in the contract wiil not have the contract renewed. The system imposes a good deal of financial and managerial discipline on service providers. The DHA is in wm accountable to the National Health Authority for the use of the funds provided. This contracting arrangement allows tlexibility in the use of a range of service providers to

meet the service needs of the people of the local area.

Service providers holding contracts with one DHA might include:

A local authority health department providing clinic services

A community hospital board

A non-government organisation (NGO) running a community health centre

A local authority health department providing environmental health services in the area A private ambulance service

A welfare organisation providing specialised care to the aged

10. The Private Sector

11.

At present most private sector service providers get no public funds directly and do no  $\mathsf{t}$ 

provide any "public" services. Attempts will be made to draw them into the NHS. The DHA will offer to pay them to provide certain services. For example a group of GPs may be offered an agreed sum to immunize children in a certain area. or the DHA could conceivably offer to pay certain traditional heaiers to provide some counselling services

though funds for this are likely to be very limited.

Private providers who accept government money and do work for the DHA in this way will have moved from being purely private sector workers to being local public service providers.

Note on health worker training institutions.

Medical schools, nursing colleges and certain departments in technikons and universitie s.

exist to train appropriate heaith workers for South Africa. They will not own or run super-specialist hospitals. The National Educational Authority will allocate funds to the medical schools. colleges and department. Tese insututions will then arrange clinical teaching racilities by negotiating contacts with a suitable range or heaith care providers.

Facilities will include clinics and community health centres. and community, specialist and sub-specialist hospitals. This mechanism will make 1t possible for a remote clinic or

rural community hospital to be used as a teaching station dy an urban university. This provides a sound organizational base ror community based medical education.

Senior staff in the instututions providing clinical teaching facilities could be appointed

jointly by the institution and the medical school to ensure high standards or care and

teaching.

Local 2g. Specialist Clinics hospitals

# Community control

The health services need to be accountable to community structures at district, regiona 1 and national levels. This means reai political involvement with the power of significan t decision making especially in relation to how money 1s spent.

Through DHA and RHA Boards. democratically elected representatives wiil be involved in the appointment of senior staff and the setting of buagets. In this way the people wiil

actually control these structures. For local service providers such as hospitals. ciini cs or

community health centres, there should be significant representation from the residents association or civics on the management structure.

#### 13. The Transition

One of the kevs to the success of the NHS wiil be the extent to which existing good services can survive the transition. The emphasis on deiegauon of responsibility and budgets to DHAs and to local providers of services. ailows for considerable local vanation and ingenuity in how best to provide szrvices. It is intended to make it easier

to move from the present situation to a more coordinated and yet more flexible nealth service.

Similarly the proposals on the ownership of facilities by the NHA (section 6). on the i ong

term employment of starf and on the transformation of f2aith worker training institutions

 $a\200\230$  should all help to racifitiate the transition.

Nevertheless transition will be uncommorable for many. parucuiarly tor those who are set in their ways. It wiil require considerable political energy and commitment to establish a successful NHS. but in (ne end the country and all its people will benefit enormously.

Addendum 1

Details of Functions at District Health Authority level.

Comprehensive Primary care.

This addendum sets out the services that should be provided in a comprehensive primary care

service. Not all of these services have been provided in the past but this description is in line

with world wide concepts of what primary care services should contain. Furthermore thes e items

comprise what communities should be demanding from their health services.

Community level functions

These are the services delivered by a lay or minimally trained health worker who lives and

works in the community. One such worker might cover 500-1000 people.

Registration of clients

Health counselling and advice

Problem identification

Defaulter tracing

.Communication to and from the formal health service.

Some more specialised functions such as geriatric and disability work by selected worke  ${\tt rs}$ 

who have had additional training. =

ON A bs 10 1D CA a dle.

Clinic level functions :

These are the services rendered by a normal local clinic of which there might be one for every  $\$ 

10-20.000 people in an urban area.

Immunization

Infant growth and development monitoring and maternal counseiling Post natal care

Antenatal care

Contraception services

Heaith education

Nutrition support

TB treatment

Sexually Transmitted Diseases (STD) treatment

Disability care in the home.

Genatnic care including home care

District nursing

Acute curative care (excluding casuaities)

Liaison with community heaith workers

Appropriate data gathering (Not processing)

Efficient communication with. and transport to. the next level of health care (community health centre or hospital).

ADDENDUM 2

Detailed functions of the National Health Authority:

- 3.
- 3
- 3. 3.
- -

8 \$7

To formulate national heaith policy including the education of health personnel.

To determine national health needs.

To allocate national health finances (as above).

To determine a set of national service provision standards eg for the ratio of clinics to

population, target infant mortality rates etc.

To determine a set of health indices to be gathered at various levels of the health ser vice

by means of which the national heaith will be monitored. These indices will form the basis of information collection at all levels of the service.

To implement a national medical supplies procurement policy — this would include medicines and medical equipment.

To act as the national agency for intersectoral co-operation in matters such as housing zg agriculture. #

## 3.8. To respond to disasters

The provision of money to District and Regional Health Authorities will be the main instrument

ior the carrying out of National Health poiicies.

Within the National Health Authority certain divisions or â\200\234clusters or activity

# " wiil be established

such as  $\hat{a}\200\234$ rehabilitation services  $\hat{a}\200\235$  or "mother and child services  $\hat{a}\200\235$ . These divisions wiil be

responsible for monitoring needs and services in their field and for reviewing all DHA budgets

to ensure that adequate provision is made for these services. The divisions wiil however be

purely functional within the NHA and they will NOT establish vertical programs in the d istricts  $% \left( 1\right) =\left( 1\right) +\left( 1\right) +\left$ 

and regions.

Draft - Proposed structure of the National Health Service Page 14

The professional statfing of clinics is based on the various categories of nurse including those with community health qualifications.

Community Health centre functions

A community health centre (such as the Alexandra Health Centre or a Cape Day Hospital) shouid

be provided for every 50-200.000 of the population in an urban area depending on the density

of housing and transport facilities. }

The services rendered by such a centre include all those provided in a normal clinic but in

addition encompass :

1 A clinical service based on doctors and advanced Primarv Health Care Nurses who see patients referred by clinics as weil as difficult cases ror on going care. eg cardiacs. disability etc.

Some specialised clinics including tor example high risk antenatal care, developmental

assessment of children and asthma.

24 hour maternity and casualty services

Facilities for overnight admission or a limited number of patients.

[PV]

4

= A simple Laboratory service

- 3 Practical involvement with the training of all categores of clinical health workers.
- 3 A basic X-ray service
- 6. Rehabilitauon centre ror disabled adults and children.
- 7. Efficient communication to levels or the service above and below.
- 3. Transport of patients to hospital or to clinic.

The professional staffing of such centres include the following categories:

General practitioners. dentists/dental zssistants/.Primary Health care Clinical Nurses. Physiotherapists, Occupational the:apists. therapy assistants. nurses. radiographers and laboratory

technologists. :

At present in the Transvaal this level of service is not very often available in one centre. Usually

the services are fragmented and provided at hospital outpatients and/or by special departments

such as the regional offices of the departments of heaith. In the Cape Province the Dav Hospitals Provide many or these services under one roof. A larger community health cent re

night provide all of these raciiities but some or these facilities may be based in the community nospital.

### The General Practitioner

it is envisaged that in the distant future comprenensive primary care services will be provided

Oy local teams or health workers that wiii include several doctors. Such a team would have

enough size. staff and facilities to provide the range of services envisaged above for a community

neaith centre. The doctors would not necessanly be the team leaders but they could provide the  $\frac{1}{2}$ 

individualised care and continuity of care which are so desirable but which are not aff ordable

at present. With economic development the community health centre may gradually give way to

sucn group practices, still financed by the District Health Authority.  $\hat{a}\200\231$ 

The place or private practitioners who supply a narrow band of episodic curative care is seen as
